**Real-Time Operating Systems Book 2 - the Practice** Jun 04 2020 There's something really satisfying about turning theory into practice, bringing with it a great feeling of accomplishment. Moreover it usually deepens and solidifies your understanding of the theoretical aspects of the subject, while at the same time eliminating misconceptions and misunderstandings. So it's not surprising that the the fundamental philosophy of this book is that 'theory is best understood by putting it into practice'. Well, that's fine as it stands. Unfortunately the practice may a bit more challenging, especially in the field of real-time operating systems. First, you need a sensible, practical toolset on which to carry out the work. Second, for many self-learners, cost is an issue; the tools mustn't be expensive. Third, they mustn't be difficult to get, use and maintain. So what we have here is our approach to providing you with a low cost toolset for RTOS experimentation. The toolset used for this work consists of: A graphical tool for configuring microcontrollers (specifically STM32F variants) - STM32CubeMX software application. An Integrated Development Environment for the production of machine code. A very low cost single board computer with inbuilt programmer and debugger All software, which is free, can be run on Windows, OSX or Linux platforms. The Discovery kit is readily available from many electronic suppliers. The RTOS used for this work is FreeRTOS, which is integrated with the CubeMX tool. The author: Jim Cooling has had many years experience in the area of real-time embedded systems, including electronic, software and system design, project management, consultancy, education and course development. He has published extensively on the subject, his books covering many aspects of embedded-systems work such as real-time interfacing, programming, software design and software engineering. Currently he is a partner in Lindentree Associates (which he formed in 1998), providing consultancy and training for real-time embedded systems. **Bare Metal C** Jan 30 2020 Bare Metal C teaches you to program embedded systems with the C programming language. You'll learn how embedded programs interact with bare hardware directly, go behind the scenes with the compiler and linker, and learn C features that are important for programming regular computers. Bare Metal C will teach you how to program embedded devices with the C programming language. For embedded system programmers who want precise and complete control over the system they are using, this book pulls back the curtain on what the compiler is doing for you so that you can see all the details of what's happening with your program. The first part of the book teaches C basics with the aid of a low-cost, widely available bare metal system (the Nucleo Arm evaluation system), which gives you all the tools needed to perform basic embedded programming. **Complex, Intelligent and Software Intensive Systems** Dec 31 2019 This book explores three interwoven and challenging areas of research and development for future ICT-enabled applications: software intensive systems, complex systems and intelligent systems. Software intensive systems are systems that extensively interact with other systems, sensors, actuators, devices and users. More and more domains are now employing software intensive systems, e.g. the automotive sector, telecommunication systems, embedded systems in general, industrial automation systems and business applications. Moreover, the outcome of web services offers a new platform for enabling software intensive systems. Complex systems research is focused on the overall understanding of systems rather than their components. Complex systems are very much characterized by the changing environments in which they operate through their multiple internal and external interactions. They evolve and adapt through (internal and external) dynamic interactions. The development of intelligent systems and agents, which is increasingly characterized by the use of ontologies, can be beneficial for software intensive systems and complex systems alike. Accordingly, recent research in the areas of intelligent systems, robotics, neuroscience, artificial intelligence, and the cognitive sciences is essential to the future development of software intensive and complex systems.
