Improving the Measurement of Consumer Expenditures Oct 03 2022 Robust and reliable measures of consumer expenditures are essential for analyzing aggregate economic activity and for measuring

differences in household circumstances. Many countries, including the United States, are embarking on ambitious projects to redesign surveys of consumer expenditures, with the goal of better capturing economic heterogeneity. This is an appropriate time to examine the way consumer expenditures are currently measured, and the challenges and opportunities that alternative approaches might present. Improving the Measurement of Consumer Expenditures begins with a comprehensive review of current methodologies for collecting consumer expenditure data. Subsequent chapters highlight the range of different objectives that expenditure surveys may satisfy, compare the data available from consumer expenditure surveys with that available from other sources, and describe how the United

U.S. Household Consumption, Income, and Demographic Changes Sep 02 2022 The impacts of the two variables of population and income growth on resources and the environment are transmitted through their effects on the demands for goods and services. To enrich our understanding of the impacts of population and income on consumer demand,

Philip Musgrove, with the assistance of Adele Shapanka, undertook the research in this volume, which was first published in 1982. This book will be of interest to students of economics and environmental studies.

The Consumption Expenditure Function Oct 23 2021

Following criticism of ideas emerged from the theoretical debate among schools of thought over the possible effects of Public Deficits, this work introduces the most realistic and best-theorized Consumption Expenditure Function development ever. The Consumption Expenditure Function formulation that comes out of a new mathematical development will include a subjective and an objective part when referring to consumption expenditure decisions. From now on, economists will only pay attention to how consumption expenditure behaves in front of changes that affect these objective and subjective parts. Microeconomic theorists have always talked about the

existence of utility indifference curves when referring to consumption expenditure decisions but every theoretical development lacks this revealing concept. Part of this work deals with a thorough analysis of this issue and presents, for the first time and to the entire international academic community, a mathematical development that will allow, from now on, to take indifference curves into consideration within every old and new economic model.

The Distribution of Consumption-expenditure Budget Shares Aug 01 2022

This paper explores the statistical properties of household consumption-expenditure budget shares distributions (HBSDs) - defined as the share of household total expenditure spent for purchasing a specific category of commodities - for a large sample of Italian households in the period 1989-2004. We find that HBSDs are fairly stable over time for each specific category, but profoundly heterogeneous across

commodity categories. We then derive a parametric density that is able to satisfactorily characterize HBSDs and: (i) is consistent with the observed statistical properties of the underlying levels of household consumption-expenditure distributions; (ii) can accommodate the observed acrosscategory heterogeneity in HBSDs. Finally, we taxonomize commodity categories according to the estimated parameters of the proposed density. We show that the resulting classification is consistent with the traditional economic scheme that labels commodities as necessary, luxury or inferior. -- Household Consumption Expenditure ; Budget Shares ; Sum of Log-Normal Distributions.

Effects Feb 01 2020
Money, Wealth and Expenditure May 18 2021 The book develops and applies a modelling framework which enables consumers' expenditure and portfolio behaviour to be analysed in an integrated manner. It extends and applies the Yale approach to financial model building associated with James Tobin. The basis of this approach is surveyed with particular emphasis on the empirical implementation of portfolio models in the UK, US and other countries, appropriate econometric estimation techniques and comparisons with other monetary modelling strategies. Empirical application of the model is particularly addressed to testing whether the composition of wealth holdings is important for expenditure and asset demands, whether concentration on 'money' at the expense of other assets and liabilities is acceptable, and whether the interrelationships stressed by Tobin's general equilibrium approach are

statistically important. The results have important implications for the recent literature on wealth effects on consumption and the overemphasis on 'money' at the expense of other financial assets and liabilities.

consumption and investment goods. Contrary to other studies, the author finds that households receiving remittances actually spend less at the margin on consumption-food and consumer goods and durables-than do households receiving no remittances. Instead of spending on consumption, households receiving remittances tend to spend more on investment goods, like education, health, and housing. The analysis shows that a large amount of remittance money goes into education. At the margin, households receiving internal and international remittances spend 45 and 58 percent more, respectively, on education, than do households with no remittances. These increased expenditures on education represent investment in human capital. Like other studies, the author finds that remittance-receiving households spend more at the margin on housing. These increased expenditures on housing represent a type of investment for the migrant, as well as a means for boosting

local economic development by creating new income and employment opportunities for skilled and unskilled workers. "--World Bank web site.

The Effect of Monetary Policy on Household Consumption in Cameroon

Aug 21 2021 Research Paper from the year 2014 in the subject Economics - Macroeconomics, general, grade: 3.8/5, , course:

MANAGEMENT, language: English, abstract: The study investigates the effect of monetary policy on household consumption in Cameroon between 1980 and 2010. The objective of the study is to find out the relationship between monetary policy on household consumption in Cameroon and to recommend policies to improve on household consumption in Cameroon. The study uses secondary time series annual data from World

Bank Group Development indicators for Cameroon. The work uses economic model showing household final consumption expenditure as a function of monetary and quasi money growth, real interest rate, total reserve and Gross National Income per capita. Given the trends of the variables estimated results indicate that Total reserve as a ratio of GNP and GNI per capita positively and significantly affect household consumption. Monetary and quasi monetary growth has a negative impact on household consumption. Policy makers therefore need to encourage Total reserve and GNI per capita. It is therefore strongly recommended that instrument of monetary policy should be used in the economy as means of influencing household consumption.

Expenditure on Food Articles

Jul 20 2021 In India, over the past several years food inflation has been a matter of great concern for the economists and policy makers. Several studies have been conducted on food inflation but the results were inadequate to arrive at policy decisions to contain it. The data on Household Monthly Per capita Consumption Expenditure on food provided by National Sample Survey Organization is useful to know the pattern of consumption and changes in the level of consumption. However, the findings of NSS do not reveal any concrete evidence in support of the popular view that the change in

the pattern and level of consumption is the outcome of high food inflation in the economy. In order to arrive at more realistic understanding in to the phenomenon we need to determine the relationship between high food inflation and Household Monthly Per capita Consumption Expenditure on food. This requires a qualitative study of the phenomenon which would uncover the fact that how people manage their household consumption expenditure on food articles along side high food inflation in the economy.

Consumption Based

Estimates of Urban Chinese

Growth Feb 12 2021 This paper estimates the household income growth rates implied by food demand in a sample of urban Chinese households in 1993-2005. Our estimates, based on Engel curves for food consumption, indicate an average per capita income growth of 6.8 percent per year in 1993-2005. This figure is

slightly larger than the 5.9 percent per year obtained by deflating nominal incomes by the CPI. We attribute this discrepancy to a small bias in the CPI, which is of a similar magnitude to the one often associated with the CPI in the United States. Our estimates indicate stronger gains among poorer households, suggesting that urban inflation up to 2005 in China was “pro-poor,” in the sense that the increase in the cost of living for poorer households was smaller than for the average one.

Measuring What We Spend

Jun 26 2019 The Consumer Expenditure (CE) surveys are the only source of information on the complete range of consumers' expenditures and incomes in the United States, as well as the characteristics of those consumers. The CE consists of two separate surveys: (1) a national sample of households interviewed five times at three-month intervals; and (2) a separate national sample of households that complete two consecutive one-week expenditure diaries. For

more than 40 years, these surveys, the responsibility of the Bureau of Labor Statistics (BLS), have been the principal source of knowledge about changing patterns of consumer spending in the U.S. population. In February 2009, BLS initiated the Gemini Project, the aim of which is to redesign the CE surveys to improve data quality through a verifiable reduction in measurement error with a particular focus on underreporting. The Gemini Project initiated a series of information-gathering meetings, conference sessions, forums, and workshops to identify appropriate strategies for improving CE data quality. As part of this effort, BLS requested the National Research Council's Committee on National Statistics (CNSTAT) to convene an expert panel to build on the Gemini Project by conducting further investigations and proposing redesign options for the CE surveys. The charge to the Panel on Redesigning the BLS Consumer Expenditure Surveys

includes reviewing the output of a Gemini-convened data user needs forum and methods workshop and convening its own household survey producers workshop to obtain further input. In addition, the panel was tasked to commission options from contractors for consideration in recommending possible redesigns. The panel was further asked by BLS to create potential redesigns that would put a greater emphasis on proactive data collection to improve the measurement of consumer expenditures. *Measuring What We Spend* summarizes the deliberations and activities of the panel, discusses the conclusions about the uses of the CE surveys and why a redesign is needed, as well as recommendations for the future.

Is Consumption Growth Consistent with Intertemporal Optimization?

Apr 16 2021 In this paper we show that some of the predictions of models of consumer intertemporal optimization are not inconsistent with the patterns of non-durable expenditure observed in US household-level data. Our results and our approach are new in several respects. First, we use the only US micro data set which has direct and complete information on household consumption. The microeconomic data sets used in most of the consumption literature so far contained either very limited information on consumption (like the PSID) or none at all, in which case consumption had to be obtained indirectly from income and changes in assets. Second, we propose a flexible and novel specification of preferences which is easily estimable and allows a general treatment of multiple commodities. We show that aggregation over commodities

can be important, both theoretically and in practice. Third, we present empirical results that show that it is possible to find a reasonably simple specification of preferences, which controls for the effects of changes in demographics and labor supply behavior over the life cycle and which is not rejected by the available data. On our preferred specification, we obtain sharp estimates of key behavioral parameters (including the elasticity of intertemporal substitution) and no rejections of theoretical restrictions. Our results contrast sharply with most of the previous evidence, which has typically been interpreted as rejection of the theory. We show that previous rejections can be explained by the simplifying assumptions made to derive empirically tractable equations. We also show that results obtained using food consumption or aggregate data can be extremely misleading.
