You will be hard-pressed to find one single area of mathematics that is taught after algebra in which algebra is not practiced in almost every situation. The most general and the most commonly used definition of algebra is the study of mathematical symbols as well as the study of the manipulation of these symbols. Mathematical symbols are one of the most basic elements of mathematics, aside from numbers themselves and operation symbols, so the study of these symbols is one of the most important studies that one can take up as far as mathematics is concerned. To that end, in this book, you will find some of the most important topics regarding algebra. These include but are not limited to the following: understanding integers and basic operations, inequalities and one-step operations; fractions and factors; the main rules of arithmetic; linear equations in the coordinate plane, expressions, equations and functions; real numbers; solving linear equations; visualizing linear functions, linear equations, linear inequalities, systems of linear equations and inequalities; exponents and exponential function; polynomials, quadratic equations, radical expression, radical equations, rational expressions; and finally, intermediate topics in algebra.

**Multiplication Made Easy** May 03 2020 This book has more than 4000 multiplication facts for daily practice by students. Each page has one set consisting of 45 problems. It is recommended for students to attempt 1 set daily for consistent practice. Book starts with times table charts for easy reference followed by some quick multiplication facts. Once students start gaining confidence in individual facts, they can attempt mixed facts. Book can be used to track practice time for each set. Date and time can be recorded at top of each page. Answer to each problem is given at the end of the book. Knowing multiplication facts is helpful not only in academics; we frequently use multiplication in our daily lives too. Just like learning to walk before you can run, learning multiplication and familiarizing yourself with numbers are building blocks for other math topics taught in school - such as division, long multiplication, fractions and algebra. Mastering the basic math facts develops automaticity in kids. Automaticity is the ability to do things without occupying the mind with the low level details that are required; this is usually the result of consistent learning, repetition, and practice. For instance, an experienced cyclist does not have to concentrate on turning the pedals, balancing, and holding on to the handlebars. Instead, those processes are automatic and the cyclist can concentrate on watching the road, the traffic, and other surroundings. Until students have developed sufficient sensory-cognitive tools supporting access to symbolic memory, they will not be able to image, store or retrieve all of the basic facts with automaticity. Therefore, students need a comprehensive, developmental, and multi-sensory structured system for developing automaticity with the facts.
